ARTICLE INFO	ABSTRACT
	There are some educational methods to use for changing educational trend better. These ways include book and without book. Libraries are centers containing many books in various subjects and fields. In fact they involve books for different needs for students, scientists, teachers and even ordinary people to obtain knowledge. The most important purpose to covering finding needs of people is information; of course we are living in information and connections ages. But we should use information and data resources in correct form. In this paper, we analyze using information resources.

INTRODUCTION

One name for this century is information and connections. Technology is developing rapidly. Under these conditions, managers of libraries olay important roles transferring information and data to users; why they could employ educated and skillful experts. Also they should help managing information systems by instruments suitable in information technology (Kaffashan, 2006). But even there are some other instruments and ways to transfer information to users and remove their needs. Indeed a user should know his/her need and covering requirement in knowledge world. He/She should find the most suitable and applied instrument and relevant books in the subject, then should use the books under a good circumstance.

MATERIALS AND METHODS

In the information explosion ages, technology plays an applied role in domain of transferring data and information, connections, education, learning and research. Extending new technologies, extension of watching-hearing materials have been necessary and unexpected factors in all countries (Bagheri, 2005). Looking for information could not be done only by using books, theses, publications and papers (Kousha, 1999). Of course the best available and simple way for researchers to remove educational and researching needs is book; referring to libraries and finding the best ones in the relevant subject. There are many libraries in Iran. They are located in schools, mosques, universities and offices, mainly. That is, people should know the importance of using and studying books. So they should register in libraries and use books under their circumstances. Without book, we could find knowledge about our around world and remove educational and research needs (Taherpour, 1977). Therefore the culture of being friends with books is an applied and good requirement in improving knowledge management. When there are enough libraries with too many books in various fields of study, registering people and study conditions should be better in useful forms. The main materials of this research are libraries and the most important method used through is analyzing use of books in removing educational and research need (Dhiman, 2005).

A Challenge

Anyone can challenge a book. The challenge process begins when someone objects to materials in a school library or public library collection. Once a book is formally challenged, it is taken off the shelf and reviewed by a committee, which may be comprised of librarians, parents, library users, board members, and teachers. Each individual library will determine whether the challenged book is made available to patrons of the library until a decision is reached.

AN ASSESSMENT OF NEED FOR THE STUDY

Research indicates that children from families across the socioeconomic spectrum achieve similar levels of reading improvement during the school year. However, while the

remain stable or improve slightly during the summer, the reading skills of children from low-income families decline. In fact, research shows that a reading achievement gap of approximately three months develops between students from lower- and higher-income families over the summer months. This loss accumulates each summer and may become a gap of eighteen months by the end of sixth grade, and two or more years by middle school.

RESULTS

Existence of libraries in offices, organizations, schools and mosques in addition to universities in each geographic zone is the first requirement for educational and research qualification for people. Establishing good, welfare, clean and suitable spaces equipped by watching-hearing instruments are the latter requirements. By this, people interested in studying and increasing their knowledge could use facilities in special field subject better.

DISCUSSION AND CONCLUSION

We could find that spaces and conditions predominant in libraries should be in good and convenient states. Equipments required for referees to use books are important applied. Manager and employees of a library in addition to requirement and instruments could influence on this process.

In fact existence of needed books, books in various subject fields and locations, regularity, respectful employees, equipment, welfare and extra instruments could supply knowledge and research doing needs for users in libraries; so knowledge management will be led to a good and useful situation in the best conditions.
